

Retail Data Integration Platform

Exact Screenshot-Matched Beginner Guide

Each screenshot below is placed next to the exact steps it demonstrates. The image numbers correspond to the screenshots extracted from the supplied project document.

Part A — Azure Resources and Storage

SCREENSHOT 1 — Azure Resource Group

Screenshot 1 — exact visual reference

1. Open Azure Portal and open the project resource group.
2. Confirm the Azure resources used by the project are visible.
3. For this project, the main resources include Azure Data Factory, Azure SQL resources and the Storage Account.
4. Do not recreate resources if they already exist; first confirm the existing names.

SCREENSHOT 2 — Raw Container — File Listing

Screenshot 2 — exact visual reference

5. Open the Storage Account.
6. Select Containers and open the raw container.
7. Use this screen to confirm that the raw zone contains the files created by ingestion.
8. If the files are missing, run PL_01_Ingest_RawZone before continuing.

SCREENSHOT 3 — Storage Account — Containers

Screenshot 3 — exact visual reference

9. At Storage Account → Containers, confirm the raw and processed containers exist.
10. Use raw for ingested source files.
11. Use processed for the transformed Sales Summary output.

Part B — Verify the Raw Data

SCREENSHOT 4 — Products.csv

Screenshot 4 — exact visual reference

12. Inside raw, open Products.csv.
13. Verify the header contains ProductID, ProductName, Category and UnitPrice.
14. Confirm multiple product records are present.
15. This file is the CSV form of the REST product catalog used by the transformation.

SCREENSHOT 5 — Products.json

Screenshot 5 — exact visual reference

16. Open Products.json in the raw container.
17. Verify the JSON contains the products collection.
18. The REST Copy Activity uses this JSON source and converts the product records into Products.csv.
19. When configuring the REST mapping, the collection reference is the products array and the field mappings are relative to each array element.

SCREENSHOT 6 — Stores.csv

Screenshot 6 — exact visual reference

20. Open Stores.csv.
21. Verify the columns StoreID and StoreName.
22. Confirm the store records are present.
23. This file is used by SourceStores in the PL_02 data flow.

SCREENSHOT 7 — dbo.Orders.csv

Screenshot 7 — exact visual reference

24. Open dbo.Orders.csv.
25. Verify OrderID, OrderDate, ProductID, StoreID, Quantity, UnitPrice and OrderStatus.
26. Confirm order records are present.
27. This is the raw output created from the SQL Orders source.

Part C — Verify the Processed Output

SCREENSHOT 8 — Processed Container

Screenshot 8 — exact visual reference

28. Open the processed container.
29. Confirm SalesSummary.csv has been generated.
30. If the processed container is empty, run PL_02_Transform_ProcessedZone.

SCREENSHOT 9 — SalesSummary.csv

Screenshot 9 — exact visual reference

31. Open SalesSummary.csv.
32. Verify that the file contains a header and actual data rows.
33. The expected output contains SalesDate, StoreID, ProductID, StoreName, ProductName, Category, TotalQuantity, TotalSales and Ordercount.
34. This is the transformed/aggregated output that PL_03 loads into Azure SQL.

Part D — Azure SQL Configuration

SCREENSHOT 10 — SQL Server Networking

Screenshot 10 — exact visual reference

35. Open the SQL Server used by the project.
36. Open Networking.
37. Confirm the required client/Azure access rules are configured so Azure Data Factory and Query Editor can reach the database.
38. Save any networking changes before testing the database connection.

SCREENSHOT 11 — Azure SQL Query Editor

Screenshot 11 — exact visual reference

39. Open the Azure SQL Database and launch Query Editor.
40. Confirm the tables dbo.Orders, dbo.WatermarkControl and dbo.SalesSummary exist.
41. Use SELECT queries to inspect the data.
42. After PL_03 runs, use SELECT COUNT(*) FROM dbo.SalesSummary to verify the target row count.

Part E — ADF Linked Services

SCREENSHOT 12 — ADF Linked Services

Screenshot 12 — exact visual reference

- 43. Open Azure Data Factory → Author.
- 44. Open Manage → Linked services.
- 45. Confirm the ADLS linked service is present.
- 46. Confirm the SQL source and SQL target linked services are present.
- 47. Confirm the REST linked service is present.
- 48. Open each connection and use Test connection where available.
- 49. Use the existing working linked service instead of creating duplicates.

Part F — Master Pipeline PL_00

SCREENSHOT 13 — PL_00 Master Pipeline

Screenshot 13 — exact visual reference

50. Open Pipelines → PL_00_Master_Orchestrator.
51. Place an Execute Pipeline activity for PL_01_Ingest_RawZone.
52. Place an Execute Pipeline activity for PL_02_Transform_ProcessedZone.
53. Place an Execute Pipeline activity for PL_03_Load_CuratedZone.
54. Connect PL_01 to PL_02 using the green Success dependency.
55. Connect PL_02 to PL_03 using the green Success dependency.
56. Enable Wait on completion for the Execute Pipeline activities.

SCREENSHOT 14 — PL_00 Successful Run

Activity name	Activity status	Activity...	Run start	Duration	Integration runtime
SP_Update_Watermark	Succeeded	Stored procedu	9/21/2026, 4:45:34 PM	14s	AutoResolveIntegrationRuntime (Central
SP_Update_Watermark	Succeeded	Stored procedu	9/21/2026, 4:45:31 PM	19s	AutoResolveIntegrationRuntime (Central
SP_Update_Watermark	Succeeded	Stored procedu	9/21/2026, 4:45:28 PM	21s	AutoResolveIntegrationRuntime (Central
Copy_S...	Succeeded	Copy data	9/21/2026, 4:45:06 PM	26s	AutoResolveIntegrationRuntime (East US
Copy_REST_Products_R...	Succeeded	Copy data	9/21/2026, 4:45:06 PM	22s	AutoResolveIntegrationRuntime (East US
GetMetadata_Stores	Succeeded	Get Metadata	9/21/2026, 4:45:05 PM	20s	AutoResolveIntegrationRuntime (East US
Switch_SourceType	Succeeded	Switch	9/21/2026, 4:45:04 PM	30s	
Switch_SourceType	Succeeded	Switch	9/21/2026, 4:45:04 PM	24s	
Switch_SourceType	Succeeded	Switch	9/21/2026, 4:45:04 PM	26s	
ForEach_Source	Succeeded	ForEach	9/21/2026, 4:45:03 PM	51s	
Lookup_ActiveSources	Succeeded	Lookup	9/21/2026, 4:44:43 PM	20s	AutoResolveIntegrationRuntime (Central

Screenshot 14 — exact visual reference

57. Debug the master pipeline.
58. Open the Output section.
59. Confirm Execute Pipeline for PL_01 succeeds.
60. Confirm Execute Pipeline for PL_02 succeeds.
61. Confirm Execute Pipeline for PL_03 succeeds.
62. If one child pipeline fails, open that child pipeline and fix it before rerunning the master.

Part G — PL_01 Ingestion

SCREENSHOT 15 — PL_01 Ingest Raw Zone

Screenshot 15 — exact visual reference

63. Open PL_01_Ingest_RawZone.
64. Confirm the Lookup reads active sources from WatermarkControl.
65. Confirm the ForEach loops through the Lookup output.
66. Confirm the Switch selects the source branch according to SourceType.
67. SQL branch: Copy Orders to raw/dbo.Orders.csv and update the watermark after success.
68. REST branch: Copy the Products JSON collection to raw/Products.csv.
69. Blob branch: validate/check the Stores file.
70. Debug PL_01 and verify the three raw outputs.

Part H — PL_02 Transformation

SCREENSHOT 16 — PL_02 Successful Execution

Screenshot 16 — exact visual reference

71. Open PL_02_Transform_ProcessedZone.
72. Debug the pipeline.

73. Confirm the Mapping Data Flow activity succeeds.
74. Open the output/run details and verify that the data flow completed successfully.

SCREENSHOT 17 — DF_Transform_ProcessedZone

Screenshot 17 — exact visual reference

75. Open DF_Transform_ProcessedZone.
76. Confirm SourceOrders, SourceProducts and SourceStores are connected.
77. Confirm invalid records are filtered.
78. Confirm the product identifier is normalized before the Products join when the two source formats differ.
79. Confirm JoinProducts is an inner join using the normalized ProductID.
80. Confirm JoinStores is an inner join using StoreID.
81. Confirm AggregateSales groups by SalesDate, StoreID, StoreName, ProductID, ProductName and Category.
82. Confirm TotalQuantity, TotalSales and Ordercount are created.
83. Confirm SinkProcessed writes the output to the processed container.
84. Use Data Preview to verify that rows are present before running the pipeline.

Part I — PL_03 SQL Load and Validation

SCREENSHOT 18 — PL_03 Load and Row-Count Validation

Screenshot 18 — exact visual reference

85. Open PL_03_Load_CuratedZone.
86. Confirm Copy_Processed_To_SQL loads SalesSummary.csv into dbo.SalesSummary.
87. Confirm the mapping contains SalesDate, StoreID, StoreName, ProductID, ProductName, Category, Ordercount, TotalQuantity and TotalSales.
88. Use Upsert/idempotent loading so rerunning the pipeline does not insert duplicate primary-key rows.
89. Connect the successful Copy activity to Lookup_SalesSummary_Count.
90. Configure the Lookup query as `SELECT COUNT(*) AS TotalRows FROM dbo.SalesSummary;`
91. Set First row only to ON.
92. Pass the Lookup result to If_Rows_Exist.
93. True branch: Validation_Success.
94. False branch: Fail_No_Rows.
95. Validate and debug PL_03.

Part J — Trigger

SCREENSHOT 19 — ADF Trigger

96. Open Manage → Triggers.
97. Create or open the schedule trigger for PL_00_Master_Orchestrator.
98. Configure the required schedule, start time and time zone.
99. Publish the trigger.
100. Confirm the trigger is enabled/started when scheduled execution is required.

Final End-to-End Order

101. Create/verify Azure resources.
102. Create/verify ADLS raw and processed containers.
103. Create/verify Azure SQL tables.
104. Configure and test linked services.
105. Configure PL_01 ingestion.
106. Run PL_01 and verify raw files.
107. Configure PL_02 transformation.
108. Run PL_02 and verify processed/SalesSummary.csv.
109. Configure PL_03 SQL load and upsert.
110. Run PL_03 and verify dbo.SalesSummary.
111. Run row-count validation.
112. Configure PL_00 master orchestration.
113. Run PL_00 successfully.
114. Configure and publish the trigger.

Important Note

The screenshots are not generic examples. They are the actual screenshots supplied in your project document, and each has been moved beside the step it demonstrates. The supplied document contains 8 pages and the screenshots cover the Azure resources, raw/processed files, SQL configuration, ADF linked services, pipelines, validation and trigger.
